LAB CYCLE 1

PROBLEM: 1

AIM : Define a class 'product' with data members pcode, pname and price. Create 3 objects of the class and find the product having the lowest price.

ALGORITHM :

Step 1: Start.

Step 2: Define a class having name Product and members as pcode,pname and price.

Step 3: Declare three objects in the class and add the values of each data members into objects.

Step 4: Using if condition check which object has the lowest price and print it.

Step 5: Stop.

PROGRAM CODE :

CO1Q1.java

```
package CO1Q1;

//Define a class 'product' with data members pcode, pname and price. Create 3
// objects of
// the class and find the product having the lowest price.
public class CO1Q1 {
    int pcode;
    String pname;
    double price;
    CO1Q1(int code, String name,double rate){
        pcode=code;
        pname=name;
        price=rate;
    }
    void display(){
        System.out.println(pcode+"\t\t"+pname+"\t\t"+price);
    }
    static void lowest(double p1, double p2, double p3){
        if(p1<p2&& p1<p3)
        {
            System.out.println("Product 1 has the lowest price");
        }
    }
}
```

```

else if(p2<p1&&2<p3){
    System.out.println("Product 2 has the lowest price");
}
else if(p3<p1&&2>p3)
{
    System.out.println("Product 3 has the lowest price");

}
}
}
public static void main(String[] args) {
    CO1Q1 obj1=new CO1Q1(1,"Shampoo",400);
    CO1Q1 obj2=new CO1Q1(2,"Glass",20);
    CO1Q1 obj3=new CO1Q1(3,"Book",100);
    System.out.println("\nProduct
Information\n\nProduct_Code\tProduct_Name\tProduct_Price");
    obj1.display();
    obj2.display();
    obj3.display();
    lowest(obj1.price,obj2.price,obj3.price);
}
}

```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

```

Run: CO1Q1 x
/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.46
-classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO1Q1.CO1Q1

Product Information

Product_Code    Product_Name    Product_Price
1      Shampoo      400.0
2      Glass        20.0
3      Book         100.0
Product 2 has the lowest price

Process finished with exit code 0

```

PROGRAM: 2

AIM : Read 2 matrices from the console and perform matrix addition.

ALGORITHM :

Step 1: Start.

Step 2: Define a class having name AddMatrix.

Step 3: Read row number(m),column number (n) and initialize the double dimensional arrays mat1[[]],mat2[[]],res[[]] with same row number ,column number.

Step 4: Store the first matrix elements into the two-dimensional array matrix mat1[[]] using two for loops. i indicates row number, j indicates column index. Similarly second matrix elements in to mat2[[]].

Step 5: Add the two matrices using for loop.

for i=0 to i<m

for j=0 to j<n

mat1[i][j] + mat2[i][j] and store it in to the matrix res[i][j] .

Step 6: Print sum of matrices res[i][j].

Stop 7: Stop.

PROGRAM CODE :

CO1Q2.java

```
package CO1Q2;
import java.util.Scanner;
public class CO1Q2 {
    public static void main(String args[])
    {
        int row, col,i,j;
        Scanner in = new Scanner(System.in);

        System.out.println("Enter the number of rows : ");
        row = in.nextInt();

        System.out.println("Enter the number columns : ");
        col = in.nextInt();

        int mat1[][] = new int[row][col];
        int mat2[][] = new int[row][col];
```

```

int res[][] = new int[row][col];
System.out.println("Enter the elements of matrix 1 : ");
for ( i= 0 ; i < row ; i++ )
{
    for ( j= 0 ; j < col ;j++ )
        mat1[i][j] = in.nextInt();
}
System.out.println("Enter the elements of matrix 2 : ");
for ( i= 0 ; i < row ; i++ )
{
    for ( j= 0 ; j < col ;j++ )
        mat2[i][j] = in.nextInt();
}
for ( i= 0 ; i < row ; i++ )
    for ( j= 0 ; j < col ;j++ )
        res[i][j] = mat1[i][j] + mat2[i][j] ;

System.out.println("Sum of matrices : ");

for ( i= 0 ; i < row ; i++ )
{
    for ( j= 0 ; j < col ;j++ )
        System.out.print(res[i][j]+"\\t");
    System.out.println();
}
}
}

```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

```

Run: CO1Q2 x
/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.40/lib/idea_rt.jar=42083:/home/rony/Downloads/idea-IC-211.7442.40/lib/idea_rt.jar -classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO1Q2.CO1Q2
Enter the number of rows :
2
Enter the number columns :
2
Enter the elements of matrix 1 :
1
2
3
4
Enter the elements of matrix 2 :
5
6
7
8
Sum of matrices :
6 8
10 12

```

PROGRAM: 3

AIM : Add complex numbers

ALGORITHM :

Step 1: Start.

Step 2: Define a class having name ComplexNumber and data members are real and imaginary number.

Step 3: Define a function ComplexNumber and add values to variables.

Step 4 : Define a function ComplexNumber sum to add complex number using 3rd ComplexNumber object and return the value.

Step 5: Print the sum value.

Step 6: Stop.

PROGRAM CODE :

CO1Q3.java

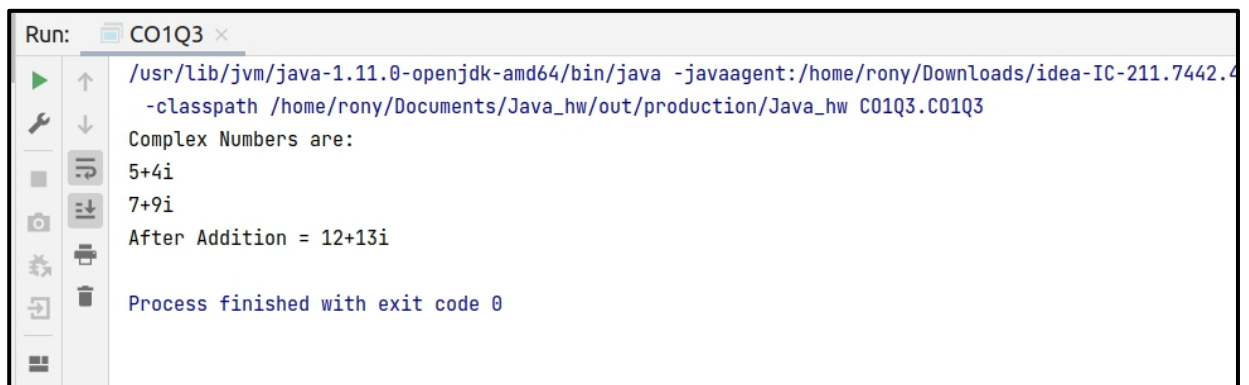

```
package CO1Q3;

//Add complex numbers
public class CO1Q3 {
    int r;
    int i;
    CO1Q3(int real,int img){
        r=real;
        i=img;
    }
    void display(){
        System.out.println(r+" "+i+"i");
    }
    static void add(int r1,int i1,int r2,int i2 ){
        r1=r1+r2;
        i1=i1+i2;
        System.out.println("After Addition = "+r1+" "+i1+"i");
    }
    public static void main(String[] args) {
        // Scanner sc =new Scanner(System.in);
        // String firstComplex=sc.nextLine();
        // String[] ar=firstComplex.split("[-+i]");
        // String secondComplex=sc.nextLine();
        // String[] ar2=secondComplex.split("[-+i]");
        CO1Q3 first=new CO1Q3(5,4);
```

```
CO1Q3 second=new CO1Q3(7,9);
System.out.println("Complex Numbers are:");
first.display();
second.display();
add(first.r,first.i,second.r,second.i);
    }
}
```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

```
Run: CO1Q3 x
/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.4
-classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO1Q3.CO1Q3
Complex Numbers are:
5+4i
7+9i
After Addition = 12+13i
Process finished with exit code 0
```

PROGRAM: 4

AIM : Read a matrix from the console and check whether it is symmetric or not.

ALGORITHM :

Step 1: Start.

Step 2 : Read row number,column number and initialize the double dimensional array with same row number ,column number.

Step 3 : Store the first matrix elements into the two-dimensional array matrix using two for loops. i indicates row number, j indicates column index.

Step 4: Check whether the matrix is symmetric or not.

Step 5: Print the symmetric matrix or if not.

Step 6: Stop.

PROGRAM CODE :

CO1Q4.java

```
package CO1Q4;
import java.util.Scanner;
public class CO1Q4
{
    public static void main(String[] args)
    {
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter the no. of rows : ");
        int rows = sc.nextInt();
        System.out.println("Enter the no. of columns : ");
        int cols = sc.nextInt();
        int matrix[][] = new int[rows][cols];
        System.out.println("Enter the elements :");
        for (int i = 0; i < rows; i++)
        {
            for (int j = 0; j < cols; j++)
            {
                System.out.println("Input number for matrix position ["+(i+1)+"]["+(j+1)+"] : ");
                matrix[i][j] = sc.nextInt();
            }
        }
        System.out.println("Printing the input matrix :");
        for (int i = 0; i < rows; i++)
        {
            for (int j = 0; j < cols; j++)
            {
```

```

        System.out.print(matrix[i][j]+"\\t");}
        System.out.println();}
//Checking the input matrix for symmetric
if(rows != cols)
{
    System.out.println("The given matrix is not a square matrix, so it can't
be symmetric."); }
else {
    boolean symmetric = true;

    for (int i = 0; i < rows; i++){
        for (int j = 0; j < cols; j++) {
            if(matrix[i][j] != matrix[j][i])
            {
                symmetric = false;
                break;}}}
    if(symmetric){
        System.out.println("The given matrix is symmetric..."); }
    else {
        System.out.println("The given matrix is not symmetric...");}}
    sc.close();
}}

```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

```

/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.40/lib/

PROGRAM: 5

AIM : Create CPU with attribute price. Create inner class Processor (no. of cores, manufacturer) and static nested class RAM (memory, manufacturer). Create an object of CPU and print information of Processor and RAM.

ALGORITHM :

Step 1: Start.

Step 2: Define a class cpu with data member price and class processor.

Step 3: Class processor contain data members no_cores, manufacturer and a nested class RAM.

Step 4: class RAM contain memory and manufacturer as data members.

Step 5: Create objects in corresponding classes and display it's details.

Step 6: Stop.

PROGRAM CODE :

CO1Q5.java	<pre>package CO1Q5; public class CO1Q5{ int price; static class processor{ int cores; String producer; processor(int noC, String manu){ cores=noC; producer=manu; } void display(){ System.out.println("\nProcessor info"); System.out.println("No. of Cores = "+cores); System.out.println("Manufacturer = "+producer+"\n"); } } class ram{ int mem; String manuf; ram(int memory,String producer){ mem=memory; manuf=producer; } void display(){</pre>
------------	---

```

        System.out.println("\nRAM info");
        System.out.println("Memory = "+mem);
        System.out.println("Manufacturer = "+manuf+"\n");
    }
}

public static void main(String[] args) {
    CO1Q5.processor obj1= new CO1Q5.processor(8,"Intel");
    CO1Q5 obj2 = new CO1Q5();
    CO1Q5.ram obj3 = obj2.new ram(8,"Samsung");
    obj1.display();
    obj3.display();

}
}

```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

```

Run: CO1Q5 x
/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.40/lib/idea_rt.jar=39893:/home/ro

LAB CYCLE 2

PROGRAM: 6

AIM : . Program to Sort strings.

ALGORITHM :

Step 1: Start

Step 2: Select the first element of the list (i.e., Element at first position in the list).

Step 3: Compare the selected element with all the other elements in the list.

Step 4: In every comparison, if any element is found smaller than the selected element (for Ascending order), then both are swapped.

Step 5: Repeat the same procedure with element in the next position in the list till the entire list is sorted.

Step 6: Stop

PROGRAM CODE :

CO2Q1.java	<pre>package CO2Q1; //. Program to Sort strings import java.util.Scanner; import java.util.Arrays; public class CO2Q1 { public static void main(String[] args) { int i,j; Scanner sc = new Scanner(System.in); System.out.println("Enter the number of words"); int num=sc.nextInt(); String word[]=new String[num]; sc.nextLine(); for(i=0;i<num;i++){ System.out.println("\nEnter a Word\n"); word[i]=sc.nextLine(); } } }</pre>
------------	---

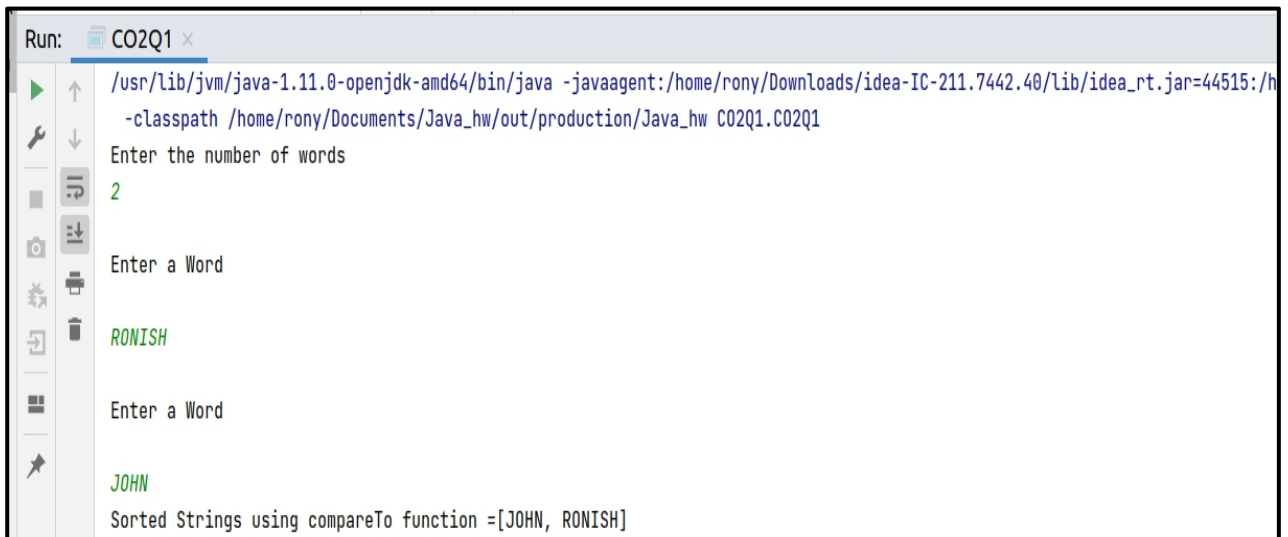

```

        for( i=0;i<num-1;i++){
            for( j=i+1;j<num;j++){
                if(word[i].compareTo(word[j])>0){
                    String temp = word[i];
                    word[i]=word[j];
                    word[j]=temp;
                }
            }
        }
        System.out.println("Sorted Strings using compareTo function
="+Arrays.toString(word));
        System.out.println(word);
    }
}

```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :
